HEATING INDUCTORS

Induction heating is a fast and clean method (in absence of open flames) used to heat metals and other conductive materials. The induction heater creates an alternating magnetic field that generates induced currents inside the material. These induced currents generate the heating.

The absence of open flames makes work safer while ensuring safety and cost savings. It allows you to work even near heat-sensitive parts.

The use of open flames is no longer permitted by EU legislation.

With SPIN heating inductors, heat ferrous materials and aluminum quickly and safely: the heating inductors will make your work better and faster!
